The abstract idea of what is the base of a collection is a little bit different than the concept of the set that is the base. To this end, I've noticed that the word "basis" seems to be used in two different contexts - the abstract concept of what is the base of a collection, and the concept of what is the base of a collection (or some other set, I'm not quite sure). Could anyone please help me to understand the difference between the two usages? I am familiar with the differences between the two sets - the set  $\mathbb{X}$  is a basis of a set  $\mathbb{Y}$  when  $\mathbb{X}$  is a subset of  $\mathbb{Y}$  and  $\mathbb{X}$  is a minimal subset of  $\mathbb{Y}$  - but this is not what I'm asking here. A: In order for you to "understand the difference" between the two uses, I would need to know why you are using the word in the first place. That is a question for you. But what I can do is to point out the similarities in how the word is used. It is used for two different purposes: It is used to mean that something, in a context, is the key concept or the core thing of that context. It is used to mean the set or relation that is the basis of that context. These two usages of the word "basis" are closely connected, but they have subtle differences. Is that thing the core of the context? The answer to this question depends on context, and will sometimes require you to specify a different word than "basis". For example, for mathematical context, it might be necessary to use "Axiom" or "Theorem" for the first purpose, and "Sets" or "Rings" for the second. Is that set or relation the basis of the context? This question requires you to specify whether you are using the word in the abstract sense (context independent), or in the concrete sense (context dependent). In particular, it might be the case that the word
